PROJECT

Implement a Matrix Class

A part of the Intro to Self-Driving Cars Program

PROJECT REVIEW | CODE REVIEW | NOTES

Meets Specifications

SHARE YOUR ACCOMPLISHMENT

Awesome job overall! You went above and beyond! You've implemented the 3x3 and 4x4 matrices which shows both your mastery of the subject and your motivation for learning more. Keep it up! It's important to stay motivated!

Now onward to the next project :-)

Correctness

✓ **If your code passes the provided tests in test.py then your project will meet specification for this criteria.**

Great job for passing all the tests!

✓ determinant() of matrix is calculated the right way and we get the correct output.

✓ trace() of matrix is calculated the right way and we get the correct output.

✓ inverse() of matrix is calculated the right way and we get the correct output.

Well done! This was possibly the trickiest part of the assignment!

✓ T() (transpose) of matrix is calculated the right way and we get the correct output.

✓ add() is calculated the right way and we get the correct output.

✓ neg() is calculated the right way and we get the correct output.

✓ sub() is calculated the right way and we get the correct output.

✓ mul() is calculated the right way and we get the correct output.

✓ rmul() is calculated the right way and we get the correct output.

Code Quality

✓ Code quality issues should NOT make a project non-passing. If the code works the project should pass. But readability is important so try to go through your code before submitting to make sure that a reviewer will be able to provide the most helpful feedback for you.
